UT Physicians Psychiatry Outpatient Clinic in the Texas Medical Center is pleased to offer a convenient, easy-to-use referral process for Transcranial Magnetic Stimulation, or TMS, services in Allscripts.

TMS is a FDA-approved treatment for patients suffering from treatment-resistant depression who have not improved adequately with medication and/or therapy. This outpatient procedure is safe and relatively painless with minimal side effects. Each session lasts approximately 20 to 30 minutes. The procedure does not require anesthesia or sedation.

TMS has also proven effective for patients who suffer from other psychiatric conditions, such as obsessive compulsive disorder, post-traumatic stress disorder, and other mood disorders.

The referral will be labeled “Transcranial Magnetic Stimulation (TMS)” and will be searchable by TMS or any part of the phrase Transcranial Magnetic Stimulation. Our technicians will reach out to patients once the referral is made to see if they qualify.
